[1] Standard Transportation Commodity Code.

[2] The price index for total railroad freight also includes STCC groups not shown separately.

[3] The figure shown for each item is its percent of total railroad freight.

[4] Dec. 1978 = 100.

[5] Indexes marked "r" are revised to correct pricing errors in July and August.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

New Sample for Telecommunications Services

Publication of producer price indexes for the major product lines of the telephone communications industry commences with this issue of *Producer Prices and Price Indexes* and will appear each month in table 15. Included in this issue are historical indexes from January 1972 to the present. (See table 16.) These indexes, part of the broader program to develop output price indexes for selected service industries, are designed to measure changes in the prices charged by producers of telecommunications services to those outside the industry. Unlike the Consumer Price Index for telephone services, which only measures prices paid by consumers, these indexes measure prices received by telephone companies for services to both business and residential users.

Prices used in the calculation of these indexes are the rates in effect on the 15th of the index month, obtained directly from the local operating companies and long-distance carriers. Prices are net of all taxes.

The classification of services is based upon the Standard Industrial Classification (SIC). The 5-digit, 7-digit, and 9-digit product index classifications were developed by BLS as a supplement to the SIC. Product indexes will be aggregated to produce a 4-digit index for the telecommunications industry as soon as indexes for the remaining product areas are complete. The indexes now being published account for approximately 70 percent of the 1972 revenues of the telephone industry. Once indexes are available for all products, information on relative importance of components will be published.

A brief definition of the services included in each index series follows.

Local service 4811-1. This index measures changes in the prices of services offered to business and residential users in the local calling area. It is divided into three components: 4811-111, business flat-rate monthly

[1] Data for May 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

[2] Telephone services contained in the Consumer Price Index cover not only local residential service but also parts of toll service, equipment leasing (such as extension phones), and non-recurring charges (such as installation).

NOTE: Historical data from January 1972 to August 1980 appear in Table 16 of this report.

charges; 4811-112, residential flat-rate monthly charges; and 4811-113, optional additional usage. The first two components measure changes for unlimited usage by those with flat-rate telephone services and for the initial prepaid usage by those with message-rated service. The charges also include rental of one telephone equipped with either dial or touchtone capability and transmission charges for those with touchtone service. The last component measures changes in prices for optional additional usage beyond the message unit allowance and for optional extended area service.

Toll service 4811-2. The message toll services (MTS) components of these series measure changes in prices for calls between local calling areas. The intrastate MTS index measures price changes for MTS usage within states; interstate MTS, between states; and international MTS, between the United States and other countries. Index series for Wide Area Telecommunications Services (WATS) measure changes in prices for both access and usage of WATS lines to interstate and intrastate customers. The intrastate WATS index measures price change for these services within states, whereas the interstate WATS index measures price change for services to and/or from the service areas that comprise the 48 continental states.

Directory advertising 4811-911. This index measures changes in the prices of advertising space in telephone directories; the unit of output includes both the type of ad purchased and the number of directory copies in which it is distributed.

Additional indexes to be developed will cover private leased lines, equipment leasing (including extension phones), nonrecurring charges (such as installation charges), and secondary production such as telegraph services.

The telecommunications indexes are based on probability samples. The local service and directory advertising components involved a sample of operating companies. Subsamples of services were selected within each of these components. Samples for toll indexes included samples of countries (international MTS), of states (intrastate MTS and intrastate WATS) and of toll calls (interstate and intrastate MTS). Revenue data for 1972, obtained from companies and from other sources such as publications of the Federal Communications Commission and the United States Independent Telephone Association, were used in developing the samples and the weights used in the index. The indexes are calculated from a modified Laspeyres formula similar to that used for other BLS price indexes.

Adjustments are made to the time series to account for quality variation. For example, when a telephone company introduces non-optional extended area service (EAS) in a local calling area, the effect is to increase both the charge for the service and the number of telephones that a subscriber may reach at the flat monthly charge. The month prior to the occurrence of EAS and the month in which it occurs are linked together in such a way as to prevent this change in service from being reflected in the index as only a price change. Similar adjustments are made in the directory advertising series to account for quality variation in the size of ads, which are sometimes reduced to conserve paper.

More detailed information on the methodology used to develop indexes for the telecommunications industry may be obtained by request from the Bureau of Labor Statistics, Office of Prices and Living Conditions, Division of Industrial Prices and Price Indexes, Washington, D.C. 20212.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

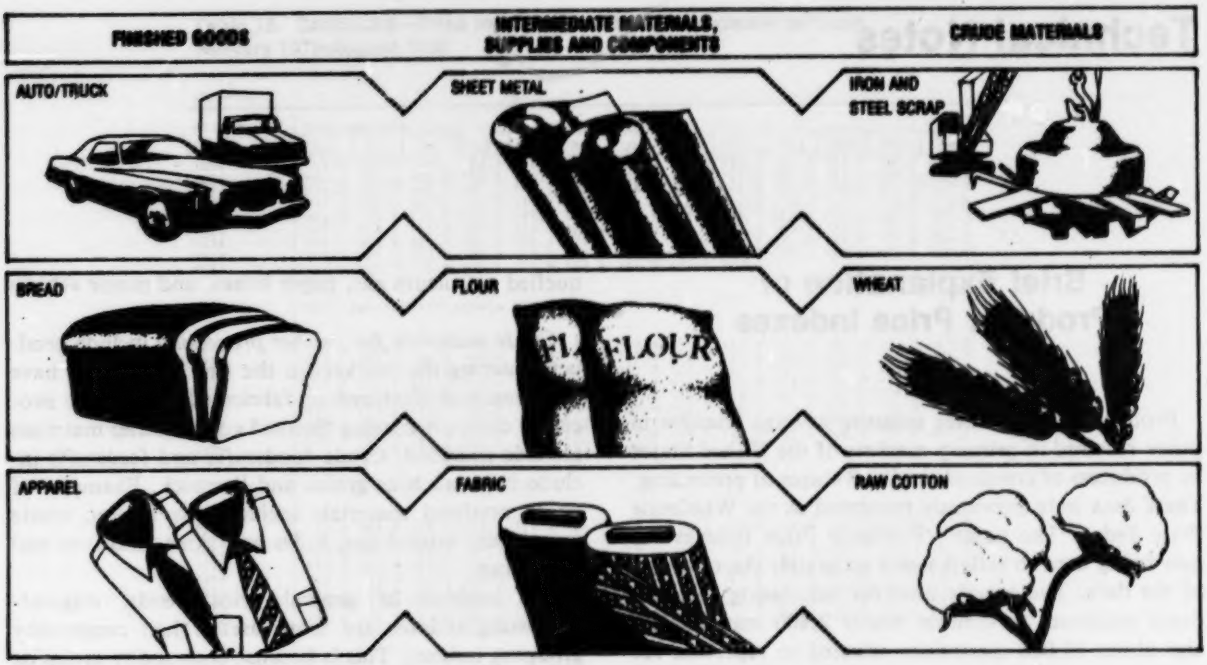
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

	Index Point Change
Finished Goods Price Index	**185.5**
less previous index	**184.5**
equals index point change	**1.0**
	Index Percent Change
Index point change	**1.0**
divided by the previous index	**184.5**
equals	**0.005**
result multiplied by 100	**0.005 x 100**
equals index percent change	**0.5**

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellanous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
October 1980

The Producer Price Index for Finished Goods moved up 0.8 percent from September to October on a seasonally adjusted basis. The October increase followed a slight decline in September and substantial advances in both July and August. Prices for intermediate (semifinished) goods rose 0.9 percent, more than in September and almost as much as in August. Crude material prices climbed 1.9 percent, after rising 1.3 percent in September and about 6 percent in both months before that (table A).

Half of the October increase of 0.8 percent in the Finished Goods Price Index was caused by higher prices for motor vehicles, while higher consumer food prices accounted for most of the rest of this advance. The introduction of 1981 model cars and trucks into the PPI in October followed large price decreases in September, when domestic producers closed out the 1980 model year with across-the-board discounts to their dealers. Consumer food prices rose 0.5 percent in October after dipping in the preceding months, and energy prices declined slightly for the second consecutive month.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 1.3 percent to 252.2 (1967 = 100). Over the year, the Finished Goods Price Index advanced 12.5 percent. Consumer food prices increased 8.5 percent from October 1979 to October 1980, energy prices climbed 30.0 percent, the index for finished consumer goods other than foods and energy rose 11.1 percent, and capital equipment prices were up 11.4 percent. The Producer Price Index for intermediate goods advanced 12.3 percent over the year, and crude material prices were 16.1 percent higher than a year ago.

a seasonally adjusted basis, after moving down 0.2 percent in September. Prices for finished consumer durables and foods turned up after declining slightly a month earlier; however, the energy goods index decreased for the second consecutive month.

The index for finished consumer goods other than foods and energy rose 0.9 percent, after showing no change in September. Passenger car prices rose 3.4 percent, following a drop of 4.2 percent in the previous month. (See "Quality Changes for 1981-Model Passenger Cars", page 4 of this issue.) The passenger care index was 9.3 percent higher in October 1980 than in the same month a year before. In addition, prices rose faster than in the previous month for over-the-counter drugs, tires and tubes, lawnmowers, and dinnerware. On the other hand, prices for jewelry and textile housefurnishings rose far less than in September.

Prices for consumer foods moved up 0.5 percent over the month, after edging down 0.2 percent in September. Prices for sugar and whole black pepper climbed 23.0 and 11.4 percent, respectively. After declining in September, prices for beef and veal and for pork rose moderately. Prices also rose for dairy products, bakery products, processed poultry, eggs, flour base mixes and doughs, and milled rice. In contrast, prices for fresh fruits and vegetables were sharply lower; decreases were also registered for fish and roasted coffee.

Prices for finished energy goods declined 0.4 percent, the same as in September. From April through October 1980, these prices edged down at an annual rate of 2.0 percent, in dramatic contrast to the 72.3 percent rate of increase during the preceding 6 months. Home heating oil prices dropped 0.5 percent in October, after edging down 0.2 percent a month earlier. Gasoline prices moved down 0.2 percent, the fifth consecutive small monthly decline.

Capital Equipment. The Producer Price Index for capital equipment advanced 1.4 percent, after edging down 0.1 percent in September. Most of the October upturn was due to an increase for motor vehicles, which had decreased sharply in September because of liquidation allowances for 1980 model cars and trucks. Prices rose more than in September for commercial furniture, construction machinery, oilfield machinery, industrial material handling equipment, pumps and compressors, and generators. On the other hand, prices for agricultural machinery, plastic and rubber industry machinery, and hand tools moved up considerably less than in the previous month.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 0.9 percent from September to October on a seasonally adjusted basis, compared with an increase of 0.6 percent in the previous month. Prices for metals, textiles, paper products, and refined sugar rose substantially in October.

The index for intermediate materials other than foods and energy rose 0.8 percent, following somewhat smaller increases in each of the 2 previous months. The nondurable manufacturing materials index moved up 0.4 percent, after edging down in the preceding month. Prices advanced after turning down in September for industrial chemicals, paperboard, and inedible fats and oils. In addition, price increases accelerated for paper, finished fabrics, gray fabrics, processed yarns and threads, and synthetic fibers. On the other hand, lower prices were recorded for nitrogenates and woodpulp.

The durable manufacturing materials index advanced 1.4 percent, about the same as in September. Much of the October increase resulted from a 2.4 percent rise in the finished steel mill products index. Increases were also registered for silver, primary aluminum, copper, lead, zinc, magnesium, nonferrous mill shapes, and gray iron castings. However tin prices fell.

The construction materials index moved up 0.5 percent, about the same as in each of the 3 previous months. Prices advanced for fabricated structural metal products, nonferrous wire and cable, building paper and board, building brick, and clay tile. In contrast, prices declined for softwood lumber, plastic construction products, gypsum products, and asphalt roofing.

The intermediate foods and fees index moved up much more than in September (6.0 vs. 0.9 percent). Most of the October increase was due to a 24.3 percent surge in prices of refined sugar used in food manufacturing. Prices were also higher for vegetable cake and meal feeds, confectionery materials, crude vegetable oils, and flour. In contrast, prices fell for animal fats and oils and refined vegetable oils.

The intermediate energy index edged down 0.2 percent, following moderate increases in 5 of the 6 preceding months and large advances during the 12 months ended in March. Prices were lower for residual fuel, commercial jet fuel, and diesel fuel, and the electric power index rose much less than in September.

Crude materials

The Producer Price Index for Crude Materials for Further Processing increased 1.9 percent in October on a seasonally adjusted basis, following a 1.3 percent rise in September. Foodstuff prices turned up in October after falling slightly in the preceding month. Prices for crude nonfood materials did not rise quite as rapidly as in September.

The index for crude foodstuffs and feedstuffs climbed 1.5 percent, following a 0.4 percent decrease in September. Wheat prices moved up more sharply than in any other recent month, and hog prices turned up after declining in the previous month. Live poultry and soybean prices also rose but considerably less than in any of the preceding 3 months. On the other hand, corn prices declined after climbing at an unusually steep rate during the 3 previous months. Prices for cattle and cocoa beans also fell, but not as much as in September.

Prices for energy materials moved up 1.8 percent, somewhat less than the 2.5 percent rise in the previous month. Natural gas prices continued to rise at a substantial pace, although not as rapidly as in September. Crude petroleum prices increased somewhat more than in September.

The index for crude nonfood materials less energy moved up 3.8 percent, after rising 4.9 percent in September. Iron and steel scrap prices increased 11.0 percent, following two consecutive monthly advances of 14.5 percent. Nonferrous scrap prices also continued to move up substantially. Prices for hides and skin surged 12.6 percent, in contrast to a 9.4 percent drop in the previous month. Prices for wastepaper, potash, and natural rubber also rose. On the other hand, cotton prices fell sharply after 3 months of rapid increases.

Quality Changes for 1981-Model Passenger Cars

The value of quality changes as estimated by BLS for the 1981-model domestic passenger cars in the Producer Price Index averaged $438.39 at the manufacturing level and $530.85 at the retail level. The estimates represent about 66 percent of the average increase of $664.57 in producers' prices and nearly all the average increase of $536.14 in manufacturers' suggested list prices. Estimates of average producers' and manufacturers' list price changes include price increases announced at the beginning of the model year as well as those announced prior to October 14, 1980.

As in past years, BLS bases these estimates on a review of data supplied by automobile producers for new model-year cars. The automobile companies supplied information for 16 1981-model domestic cars priced in the Consumer and Producer Price Indexes. Of these 16 cars, three underwent resizing and are not included in the price and quality change estimates.

These estimates of quality change are used to compile the Producer Price Index for October when the new model-year cars are introduced to the public by dealers. Estimates of quality change are also used to compile the Consumer Price Index starting in October.

The $530.85 estimated retail value of the quality changes breaks down as follows.

- **$466.65 for changes to reduce emissions to meet current and anticipated Federal air quality standards and for changes to improve fuel economy in accordance with Federal Corporate Average Fuel Economy (CAFE) standards. Where changes were made for both emission control and fuel economy, manufacturers found it impossible to supply separate values for each quality adjustment category. Claimed values for emission control and fuel economy were therefore combined this year.**

- **$4.29 for changes to meet current and anticipated safety standards including $3.59 to meet Federal Motor Vehicle Safety Standard 208 for improved crash protection standards.**

- **$59.91 for other changes not related to emissions, fuel economy, or safety standards, such as chassis changes for improved corrosion protection, and for improved warranties.**

ERRATA: Supplement to Producer Prices and Price Indexes, Data for 1979

In the latest annual supplement to this publication, 1979 data in table 6 for the commodity subgroup for Meats, poultry, and fish (commodity code 02-2) and for all levels of detail within the product class for Meats (commodity code 02-21) were inadvertently printed out of sequence. In addition, indexes for some primary nonferrous metal refinery shapes (commodity code 10-22) were inadvertently truncated for indexes greater than 999.9.

Corrected data appear below, by commodity code; corresponding titles may be found in table 6 of this issue. All indexes are based on 1967=100 unless otherwise specified.

[1] Comprehensive relative importance figures are computed once each year in December.

[2] Data for June 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum.

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

[9] Percent of total crude materials.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure snown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Data for June 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

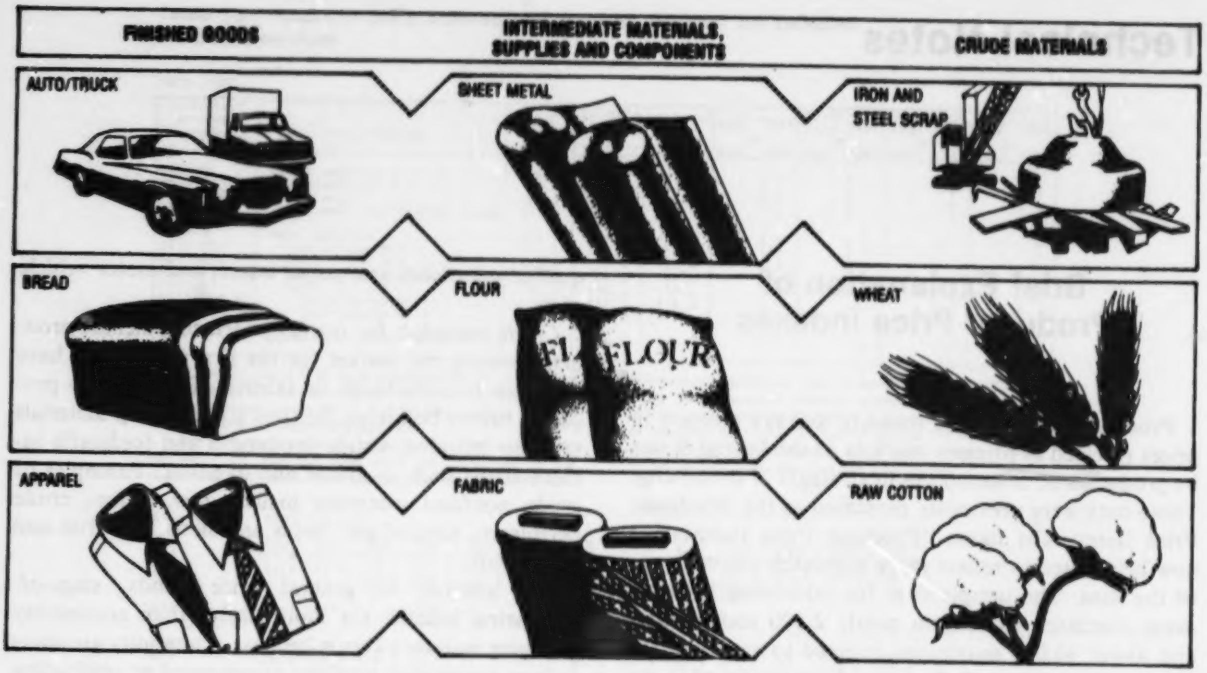
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays, For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellanous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodolgy of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
November 1980

The Producer Price Index for Finished Goods moved up 0.6 percent from October to November on a seasonally adjusted basis. The November increase followed a 0.8 percent rise in October. Prices for intermediate (semifinished) goods rose 1.0 percent, about the same as in October and substantially more than in September. Crude material prices advanced 1.1 percent, somewhat less than in either of the 2 previous months (table A).

Among finished goods, price increases slowed for motor vehicles and a broad range of capital goods. Consumer food prices rose 0.5 percent for the second consecutive month. In contrast, the finished energy goods index turned up after edging lower in most months since last spring.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.4 percent to 253.2 (1967 = 100). Over the year, the Finished Goods Price Index rose 11.9 percent. From November 1979 to November 1980, prices for consumer foods increased 7.1 percent, the energy goods index advanced 28.1 percent, finished consumer goods other than food and energy climbed 11.0 percent, and the capital equipment index was up 11.3 percent. The Producer Price Index for intermediate goods was 12.4 percent higher than a year ago, and crude material prices rose 16.1 percent over the year.

Finished goods

Finished consumer goods. The Producer Price Index for finished goods advanced 0.7 percent in November on a seasonally adjusted basis, following a 0.6 percent increase in October. Prices for finished energy goods advanced 1.3 percent, after falling 0.4

percent in both September and October. Gasoline prices climbed 1.7 percent, after declining for 5 consecutive months; home heating oil prices rose 0.9 percent following 2 months of small decreases.

Prices for consumer foods increased 0.5 percent for the second consecutive month. The largest advances occurred for pork, cereal and bakery products, dairy products, peanut butter, confectionery end products, fresh fruits and vegetables, pecans, vegetable oil end products and fish. Prices declined for beef and veal, processed poultry, and package cocoa. Refined sugar prices were virtually unchanged, following a 23 percent jump in October.

The index for finished consumer goods other than foods and energy increased 0.6 percent, somewhat less than the 0.9 percent upward movement in October. This deceleration was accounted for by slower price increases for passenger cars, which rose 0.7 percent after a 3.4 percent increase in the previous month, when 1981 models were introduced. Prices turned down for gold jewelry, disposable plastic dinnerware, and tires and tubes. In contrast, increases accelerated for beverages, cosmetics, tobacco products, and prescription drugs. Home electronic equipment prices advanced steeply, following several months of minor changes. Prices for over-the-counter drugs climbed rapidly for the third consecutive month.

Capital equipment. The Producer Price Index for capital equipment rose 0.6 percent, after increasing 1.4 percent a month earlier. Prices for motor vehicles advanced much less than in October. Price increases also slowed for several other capital goods, particularly commercial furniture, railroad equipment, construction machinery, chemical industry machinery, generators, industrial materials handling equipment, and oilfield machinery. Prices for aircraft, transformers and power regulators, pumps and compressors, and hand tools moved down, following substantial advances in the preceding month.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components registered a 1.0 percent seasonally adjusted increase in November, about the same as the 0.9 percent rise in October. The intermediate energy index rose 1.7 percent, following a small decline in October. The upturn was almost entirely due to large advances for residual fuel oil and liquefied petroleum gas; other energy prices were virtually unchanged.

The intermediate foods and feeds index also increased 1.7 percent; this was considerably less than the 6.0 surge in the previous month. Most of the slowdown was caused by a much smaller price increase for refined sugar for food manufacturing. Flour prices turned down following 6 months of steady increases. On the other hand, prices turned up sharply after falling in the previous month for animal fats and oils and refined vegetable oils. Prices for feeds and crude vegetable oils also were higher.

The index for intermediate materials less foods and energy rose 0.8 percent for the second consecutive month; in contrast, this index had registered average monthly increases of 0.4 percent during the 7 months ended in September. In November, prices for construction materials and nondurable manufacturing materials advanced more than in October, but increases slowed for durable manufacturing materials and manufacturing components.

The construction materials index moved up 1.1 percent, following a 0.5 percent increase in October. Prices advanced for plywood, millwork, fabricated structural metal products, and building paper and board. Prices for softwood lumber, gypsum products, plastic construction products, and insulation materials turned up after falling the month before. On the other hand, asphalt roofing prices declined for the fourth consecutive month.

The nondurable manufacturing materials index also rose considerably more than in the preceding month. Prices for inorganic industrial chemicals advanced even more sharply than in recent months, and prices for plastic resins and pharmaceutical materials moved up after little or no change in October. The indexes for paper, paperboard, gray fabrics, processed yarns and threads, and inedible fats and oils continued to increase substantially.

The durable manufacturing materials index increased 0.8 percent, following a 1.4 percent jump in the previous month. This slowdown was mostly due to lower prices for gold, silver, jewelers' materials, copper, lead, and tin. However, prices continued to increase substantially for finished steel mill products, aluminum and aluminum shapes, zinc, and flat glass.

The manufacturing components index edged up 0.3 percent, considerably less than in most recent months. The deceleration resulted chiefly from smaller increases for motor vehicle parts, electronic components, and bearings. In contrast, prices advanced more than in October for internal combustion engines, builders' hardware, and stationary fans and blowers. Among other intermediate goods, large increases occurred for photographic supplies, glass containers, and mining machinery parts.

Crude materials

The Producer Price Index for Crude Materials for Further Processing increased 1.1 percent in November on a seasonally adjusted basis, following a 1.9 percent rise in October. Although crude energy prices moved up about as much as in most recent months, other crude materials advanced considerably less than in October.

The index for crude foodstuffs and feedstuffs rose 0.6 percent, following a 1.5 percent climb in October. Prices for raw cane sugar and wheat dropped after rising dramatically in October. Prices for corn, cocoa beans, and live poultry also moved down over the month, and the soybean index increased much less than in most recent months.

The index for crude nonfood materials less energy moved up 2.2 percent, after rising 3.8 percent in October. Nonferrous scrap prices moved up less than in either of the previous 2 months, and iron and steel scrap prices fell after 3 months of rapid advances. Wastepaper prices also turned down. The hides and skins index advanced substantially, although not as much as in October. Raw cotton prices turned up after falling in the previous month. Higher prices were also registered for sand and gravel.

Prices for crude energy materials moved up 1.6 percent, about the same as the 1.8 percent rise in the previous month. Natural gas prices continued to rise substantially. Coal prices climbed 1.4 percent, the largest monthly advance since April 1978. Crude petroleum prices were virtually unchanged.

Upcoming Revisions in the Stage-of-Processing Indexes

Beginning with January 1981 data to be released on February 13, producer price indexes at all stages of processing will reflect updated industry input-output relationships and improved classification of some products. The text and tables 1 and 2 of this report are based on stage-of-processing data, developed from PPI commodity indexes regrouped into various categories—crude, intermediate, or finished goods—according to the latest available input-output values. (For a definition of the major stage-of-processing categories, see "Brief Explanation of Producer Price Indexes," at the back of this publication).

The new stage-of-processing relationships will be based upon the 1972 input-output tables prepared by the Bureau of Economic Analysis of the U.S. Department of Commerce. Since January 1976, stage-of-processing indexes have been based on relationships from the 1967 input-output tables.

The most significant reclassification will be reflected in the Finished Goods Price Index and in the Crude Materials Price Index as a result of a change in the allocation of the natural gas index (PPI commodity code 05-31). Until now, the entire weight of this index has been allocated to the stage-of-processing index for crude fuels. However, approximately half the weight of this index will be allocated to the stage-of-processing index for consumer nondurable goods excluding foods, since households purchase natural gas in an essentially unprocessed form. In addition, the Finished Goods Price Index will no longer incorporate weights reflecting the value of shipments purchased by the government or exported, since these categories do not fit the existing components of the Finished Goods index—finished consumer goods and capital equipment. New input-output tables are sufficiently detailed for the first time to permit the separation of weights for government purchases and exports, for which prices have not been collected.

Revised historical stage-of-processing indexes from January 1976 through December 1980 will also be released February 13 to reflect the updated stage-of-processing relationships and reclassifications, as well as the separation of the weights for government purchases and exports from the Finished Goods Price Index. Previously reported indexes for individual commodities and commodity groupings will not be affected by these revisions.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

[2] Data for July 1980 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

[3] Seasonal commodity—no price available this month.

[4] Some of the titles of the individual commodity price indexes included in this grouping are not shown.

[5] Not available.

[6] Prices for some items in this grouping are lagged 1 month.

[7] Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

[8] Prices for natural gas (05-31) are lagged 1 month.

[9] Includes only domestic production. Some prices are lagged 1 month.

[10] Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

[11] Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

[12] Some prices for industrial chemicals (06-1) are lagged 1 month.

N.E.C. Not elsewhere classified.

[1] Data for July 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

[1] Data for July 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

[2] Telephone services contained in the Consumer Price Index cover not only local residential service, but also parts of toll service, equipment leasing (such as extension phones), and non-recurring charges (such as installation).

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

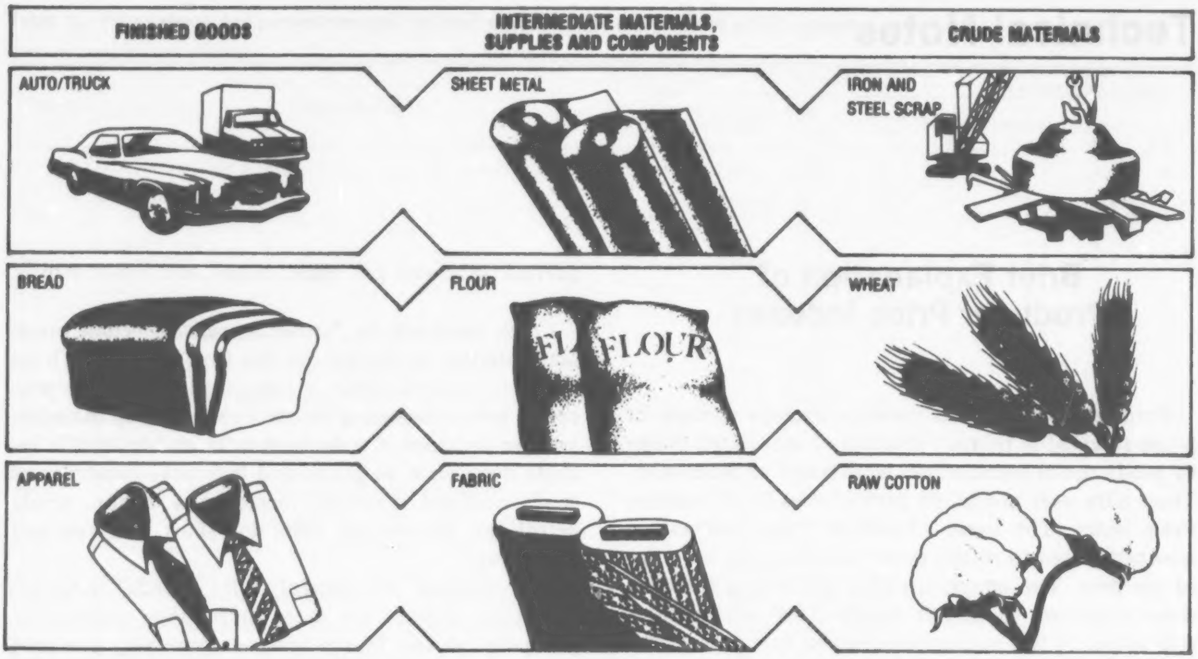
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays, For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellanous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
December 1980

The Producer Price Index for Finished Goods moved up 0.6 percent from November to December on a seasonally adjusted basis. The December rise was the same as in November and was slightly smaller than the 0.8 percent increase in October. Prices for intermediate goods climbed 1.3 percent, following increases of 1.0 and 0.9 percent in November and October. Crude material prices fell 1.3 percent, the first decline since last April (table A).

Among finished goods, prices for capital equipment and energy goods advanced somewhat more than in November. On the other hand, consumer food prices decreased slightly, the fourth consecutive small monthly change. Prices for consumer goods other than food and energy moved up 0.6 percent for the second consecutive month.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.6 percent to 254.7 (1967 = 100). From December 1979 to December 1980, price indexes for each of the three major stage-of-processing groupings—finished, intermediate, and crude goods—rose at double-digit rates, although each of these rates was somewhat slower than the corresponding 1979 pace. The Finished Goods Price Index climbed 11.7 percent in 1980, following a 12.6 percent advance in 1979. This slowdown in 1980 was partly due to the deceleration in the rate of increase for the finished energy goods index, which climbed 27.2 percent after soaring 62.7 percent in 1979. Another moderating influence was consumer food prices, which rose 6.5 percent in 1980, following a 7.6 percent advance during the previous 12 months. On the other hand, prices for finished goods other than food and energy rose more in 1980 (11.0 percent) than in 1979 (9.3 percent); on average, prices of these goods advanced rapidly in early 1980 and then moderated as the year progressed. earlier stages of processing, the price index for intermediate goods moved up 12.6 percent over the year, after increasing 16.0 percent from December 1978 to December 1979, and crude material prices climbed 13.3 percent, following a 17.3 percent jump during the 12 months ended in December 1979.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 0.5 percent in December on a seasonally adjusted basis, following a 0.7 percent increase in November. Prices for consumer foods fell 0.4 percent from November to December after rising 0.5 percent in both November and October. Prices turned down sharply in December after increasing in November for pork, refined sugar, and fresh fruits, and prices for processed poultry and roasted coffee fell more than a month earlier. Beef and veal prices edged down, following a much larger decrease in November. Prices also declined for fish and pecans. However, increases were registered for dairy products, bakery products, frozen meat pies, fresh and dried vegetables, peanut butter, black pepper, processed fruits and vegetables, and eggs.

The index for finished energy goods advanced more than 1 percent for the second consecutive month, following several months of generally declining prices. Heating oil prices rose 1.9 percent, compared with a 0.9 percent rise in the previous month. Gasoline prices increased 1.5 percent, following a 1.7 percent advance a month earlier.

The index for finished consumer goods other than food and energy increased 0.6 percent, the same as in November. The largest advances occurred for apparel, floor coverings, household flatware, silver jewelry, and sanitary papers and health products. On the other hand, passenger car prices were virtually unchanged after a modest rise in November and a large increase in October.

Capital equipment. The Producer Price Index for capital equipment rose 1.0 percent, more than the 0.6 percent rise in November but less than the 1.4 percent advance in October. Prices for aircraft, agricultural machinery, chemical industry machinery, pumps and compressors, metal forming machine tools, generators and generator sets, and hand tools rose considerably after little or no change in November. On the other hand, motor truck prices moved down slightly following 2 months of increases.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 1.3 percent in December on a seasonally adjusted basis, the largest rise since last February. Nearly half of the increase, however, was due to a 16.8 percent advance for motor vehicle parts. Energy price increases also accelerated. On the other hand, prices for foods and feeds turned down markedly, following several months of large increases.

The intermediate energy index rose 3.5 percent, more than in any month since early 1980. Residual fuel prices climbed 14.0 percent, even more than the 7.9 percent advance in November. The price indexes for electric power, commercial jet fuel, and diesel fuel registered large increases after little or no change in November. Liquefied petroleum gas prices were up substantially for the second consecutive month, following 8 months of relatively small changes.

The construction materials index advanced 1.3 percent, slightly more than in November. Most of the December rise was caused by increases for bituminous paving materials, softwood lumber, millwork, and fabricated structural metal products. Plywood prices declined, however.

The nondurable manufacturing materials index rose 1.0 percent, almost as much as in the previous month. Higher prices were recorded for paper, woodpulp, processed yarns, inedible fats and oils, and leather. In contrast, prices turned down after rising in November for gray fabrics, plastic resins, and paperboard.

The durable manufacturing materials category edged up 0.2 percent, considerably less than in either of the 2 preceding months. Prices for copper, gold, silver, tin, and lead fell sharply for the second consecutive month. On the other hand, prices continued to increase substantially for steel mill products and zinc.

The intermediate foods and feeds index fell 7.5 percent, after rising at a 58.4 percent annual rate from April through November. Most of the reversal resulted from a 23 percent drop in prices for refined sugar for food manufacturing; in contrast, these prices had more than doubled during the first 11 months of 1980. The indexes for feeds and crude vegetable oils also turned down, while prices continued to move up sharply for animal fats and oils.

Crude materials

The Producer Price Index for Crude Materials for Further Processing decreased 1.3 percent in December on a seasonally adjusted basis, following a 1.1 percent rise in November. Crude foodstuff prices turned down after 2 months of increases. The index for crude materials other than food and energy was unchanged, following 5 months of steep advances. Crude energy prices continued to rise at about the same rate as in each of the previous 3 months.

The index for crude foodstuffs and feedstuffs fell 3.3 percent, following a 0.6 percent rise in November. Raw cane sugar prices dropped 28.5 percent, following a 28.2 percent jump in October and a 4.1 percent decline in November. Led by a sharp decrease in hog prices, the livestock index fell after rising in November. Wheat prices moved down considerably more than in the previous month. Soybean prices fell sharply, after climbing rapidly since early summer. Green coffee prices also declined. On the other hand, peanut prices were more than three times higher than their last reported price in August. Prices for fluid milk and live poultry also rose, and cocoa bean prices moved up after declining for 9 consecutive months.

The index for crude nonfood materials less energy was unchanged; from June through November, these prices had climbed at a seasonally adjusted annual rate of 63.4 percent. Prices for both nonferrous scrap and natural rubber dropped for the first time since June. Prices of hides and skins fell after rising more than 10 percent in both October and November. On the other hand, iron and steel scrap prices rose after falling in the previous month. Raw cotton and leaf tobacco prices rose substantially.

Prices of crude energy materials moved up 1.5 percent, about the same as the 1.6 percent increase in the previous month. Crude petroleum prices rose more than in most recent months, while natural gas prices rose less than in any of the preceding 3 months.

Upcoming Revisions in the Stage-of-Processing Indexes

Beginning with January 1981 data to be released on February 13, producer price indexes at all stages of processing will reflect updated industry input-output relationships and improved classification of some products. The text and tables 1 and 2 of this report are based on stage-of-processing data, developed from PPI commodity indexes regrouped into various categories—crude, intermediate, or finished goods—according to the latest available input-output values. (For a definition of the major stage-of-processing categories, see "Brief Explanation of Producer Price Indexes," at the back of this publication).

The new stage-of-processing relationships will be based upon the 1972 input-output tables prepared by the Bureau of Economic Analysis of the U.S. Department of Commerce. Since January 1976, stage-of-processing indexes have been based on relationships from the 1967 input-output tables.

The most significant reclassification will be reflected in the Finished Goods Price Index and in the Crude Materials Price Index as a result of a change in the allocation of the natural gas index (PPI commodity code 05-31). Until now, the entire weight of this index has been allocated to the stage-of-processing index for crude fuels. However, approximately half the weight of this index will be allocated to the stage-of-processing index for consumer nondurable goods excluding foods, since households purchase natural gas in an essentially unprocessed form. In addition, the Finished Goods Price Index will no longer incorporate weights reflecting the value of shipments purchased by the government or exported, since these categories do not fit the existing components of the Finished Goods index—finished consumer goods and capital equipment. New input-output tables are sufficiently detailed for the first time to permit the separation of weights for government purchases and exports, for which prices have not been collected.

Revised historical stage-of-processing indexes from January 1976 through December 1980 will also be released February 13 to reflect the updated stage-of-processing relationships and reclassifications, as well as the separation of the weights for government purchases and exports from the Finished Goods Price Index. Previously reported indexes for individual commodities and commodity groupings will not be affected by these revisions.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

[2] Data for August 1980 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

[3] Seasonal commodity—no price available this month.

[4] Some of the title of the individual commodity price indexes included in this grouing are not shown.

[5] Not available.

[6] Prices for some items in this grouping are lagged 1 month.

[7] Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

[8] Prices for natural gas (05-31) are lagged 1 month.

[9] Includes only domestic production. Some prices are lagged 1 month.

[10] Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

[11] Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

[12] Some prices for industrial chemical (06-1) are lagged 1 month.

N.E.C. Not elsewhere classified.

[1] Data for August 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low reponse rates, which ranged from 30 to 60 percent for these indexes.

These indexes are calculated by combining the indexes listed below by commodity code after each special commodity grouping (titles in table 6). The weights are those used for the comprehensive All Commodities index.

[2] Data for August 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

All commodities, less farm products: 02 through 15

All foods: 01-1,01-7, and 02 less 02-61, 02-62, and 02-9

Processed foods: 02 less 02-61, 02-62, and 02-9

Industrial commodities, less fuels and power: 03, 04, and 06 through 15

Selected textile mill products: 03-27, 03-37-01-05, 03-37-01-07, 03-37-01-09, 03-37-01-11, 03-37-03-42, 03-4, 03-81-01-55, 03-81-01-72, 03-81-01-73, 03-81-02-39, 03-81-02-72, 03-81-02-74, 03-81-03-62, 03-82-01, 03-82-02, 03-83-03-22, 03-83-03-42, and 12-31

Hosiery: 03-81-01-72, 03-81-01-73, 03-81-02-74, 03-81-03-64

Underwear and nightwear: 03-81-01-74, 03-81-01-75, 03-81-01-76, 03-81-01-77, 03-81-01-78, 03-81-02-74, 03-81-02-75, 03-81-02-78, and 03-81-03-62

Chemical and allied products, including synthetic rubber and synthetic fibers: 03-1, 06 less o6-4, and 07-11-02

Pharmaceutical preparations: 06-35 and 06-36

Lumber and wood products, excluding millwork and other wood products: 08-1 and 08-3

Special metals and metal products: 10, 11-1, and 14-1

Fabricated metal products: 10-3, 10-4, 10-5, 10-6, 10-7, and 10-8

Copper and copper products: 10-22-01-06, 10-22-01-08, 10-22-01-13, 10-23-01, 10-24-01-06, 10-25-02, and 10-26-01

Machinery and motive products: 11 and 14

Machinery and equipment, except electrical: 11-1, 11-2, 11-3, 11-4, 11-6, 11-9

Agricultural machinery, including tractors: 11-11, 11-12 less 11-11-51 and 11-12-51

Metalworking machinery: 11-32, 11-33-04, 11-37, and 11-38

Numerically controlled machine tools: 11-37-11-11, 11-37-11-12, 11-37-14-11 and 11-37-16

Total tractors: 11-11 and 11-28 less 11-11-51

Industrial valves: 11-49-01-01 through 11-49-01-06, 11-49-01-16 through 11-49-01-19, 11-49-01-21 through 11-49-01-27

Industrial fittings: 11-49-01-11 through 11-49-01-15

Abrasive grinding wheels: 11-36-11, 11-36-12, 11-36-13, 11-36-14, 11-36-15

Agricultural machinery and equipment, less parts (old commodity code (11-1): 11-1 less 11-11-1 and 11-12-51

Farm and garden tractors, less parts (old commodity code 11-11): less 11-11-51

Agricultural machinery excluding tractors, less parts (old commodity code 11-12): 11-12 less 11-12-51

Construction materials: 06-21, 07-21, 08-11, 08-12-01-01, 08-12-01-02, 08-12-01-31, 08-12-01-71, 08-2, 08-3, 09-2, 10-13-02-39, 10-13-02-48, 10-13-02-55, 10-13-02-63, 10-13-02-69, 10-13-02-71, 10-13-02-89, 10-13-02-91, 10-15-01-31, 10-15-01-32, 10-15-01-33, 10-25-01-01, 10-25-01-03, 10-25-01-04, 10-25-01-05, 10-25-01-17, 10-25-01-18, 10-25-01-19, 10-25-01-21, 10-25-01-23, 10-25-02-51, 10-25-02-52, 10-25-19-93, 10-26-01-06, 10-26-01-07, 10-26-01-09, 10-26-01-11, 10-26-02-67, 10-26-02-71, 10-41-01, 10-5, 10-6, 10-71, 10-73-01-01, 10-73-01-06, 10-73-01-11, 10-73-01-12, 10-73-01-13, 10-73-01-14, 10-73-01-15, 10-73-01-55, 10-73-01-57, 10-74-01-01, 10-74-01-31, 10-74-01-81, 10-74-01-82, 10-74-01-87, 10-74-01-91, 10-74-01-95, 10-81-01-46, 10-83-01-01, 10-83-01-03, 10-83-01-05, 10-83-01-07, 10-83-01-09, 10-83-01-11, 10-83-01-21, 10-83-01-23, 10-83-01-31, 10-83-01-33, 10-83-01-35, 10-83-01-37, 10-83-01-41, 10-83-01-46, 10-83-01-48, 10-89-01-26, 10-89-01-33, 10-89-01-51, 11-42, 11-47, 11-49-01-02, 11-49-01-06, 11-49-01-12, 11-49-01-15, 11-71-01-01, 11-71-01-02, 11-71-01-03, 11-71-01-04, 11-71-02-65, 11-71-02-71, 11-71-02-73, 12-11-01-06, 12-32, 13-11-01-01, 13-11-02-07, 13-2, 13-3, 13-4, 13-6, 13-7, 13-91, 13-92, 13-93

[1] Standard Transportation Commodity Code.

[2] The figure shown for each item is its percent of total railroad freight.

[3] The price index for total railroad freight also includes STCC groups not shown separately.

[4] Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

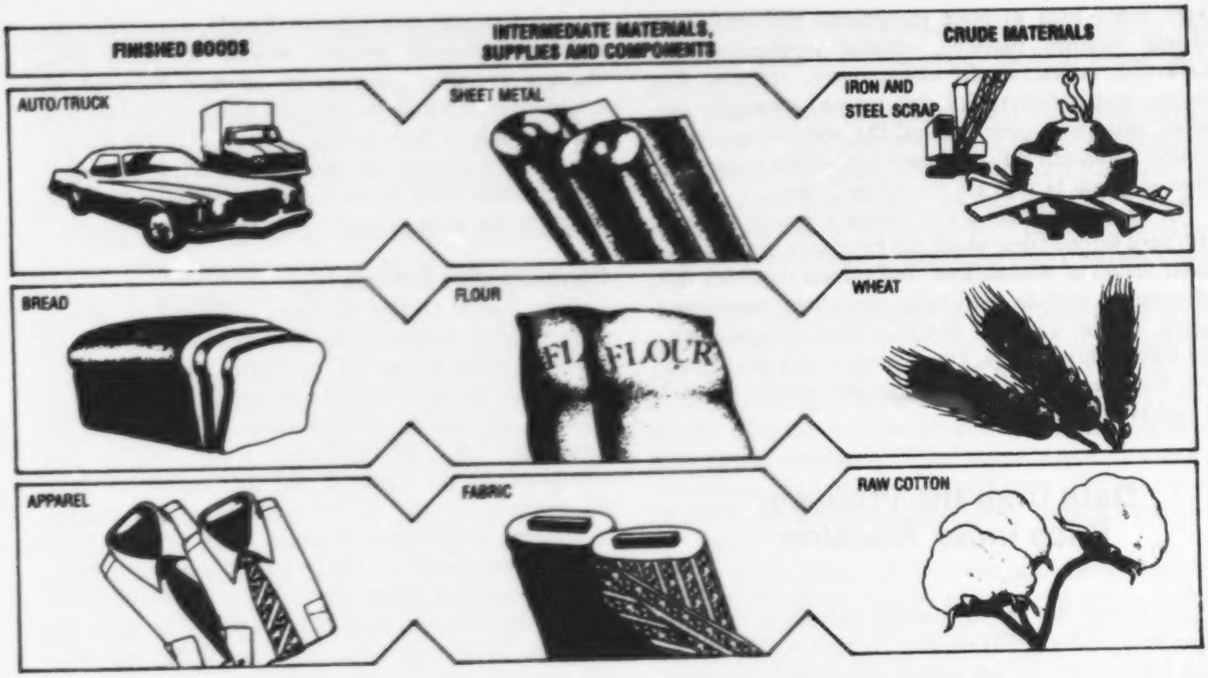
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellanous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.
